                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of the truncated form of human matriptase, a crypsin-like protease, as deduced from cDNA (see AAA8892) obtained from CC human breast cancer cell cDNA by RT-PCR. The full-length form (see CAAB19552) has an additional 172 N-terminal amino acids. Bither form can be produced in transformed or transfected cells using a claimed method. CT he zymogen (inactive) form of matriptase is a single-chain protein. The cactive 2-chain form strongly interacts with fragments of a Kunitz-type cells protease inhibitor (hepatocyte growth factor activator inhibitor, CHAI-1) to form SDS-stable complexes. In breast cancer cells, matriptase is detected in human milk. The invention is directed to a method of cetecting a malignancy or a pre-malignant lesion in breast or other ctissue by detecting the presence of single- or 2-chain forms of comprovate in the tissue. The object is to inhibit tumour onset, tumour growth and metastasis. Malignancies and pre-malignant conditions contriptase are treated by administering an inhibitor of matriptase, cespecially a Bowman-Birk inhibitor. The pre-malignant condition is atypical ductal hyperplasia of the breast, actinic keratosis, consisting consistin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                       This sequence represents a human peptidase, designated HPEP-1. The invention relates to 18 human peptidases designated HPEP-1 to HPEP-18, respectively. The peptidases can be used for treating a disease or condition associated with decreased expression or over expression of functional human peptidases. The diseases that can be diagnosed, prevented and treated include cell proliferative disorders (such as arteriosclerosis, psoriasis, myelofibrosis, and cancers), autoimmune/inflammatory disorders (such as AIDS, anaemia, allergies, Crohn's disease, asthma, atherosclerosis, Grave's disease, multiple sclerosis, and scleroderma), infections, and metabolic disorders (such addition's disease, diabetes, cystic fibrosis, glycogen storage disease

CC The zymogen (inactive) form of matriptase is a single-chain protein. The CC active 2-chain form strongly interacts with fragments of a Kunitz-type CC serine protease inhibitor (hepatocyte growth factor activator inhibitor, CC HA1-1) to form SDS-stable complexed form. Dreast cancer cells, matriptase CC in detected in human milk. The invention is directed to a method of Cd detecting a malignancy or a pre-malignant lesion in breast or other CC tissue by detecting the presence of single- or 2-chain forms of CC matriptase in the tissue. The object is to inhibit tumour onset, tumour CC growth and metastasis. Malignancies and pre-malignant conditions CC characterised by expression of the zymogen or activated form of CC matriptase are treated by administering an inhibitor of matriptase, CC especially a Bowman-Birk inhibitor. The pre-malignant condition is CC elekoplakia, Barrett's epithelium of the esophagus, ulcerative colitis, CC disease, bowenoid papulosis, vulvar intraepithelial neoplasia or CC dysplatic changes to the cervix. The invention also provides methods for in vivo or in vitro diagnosis of malignancy or pre-malignant lesion, and CC inhibitors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of the full-length form of human matriptase, a trypsin-like protease. This has an additional 172 amino acids compared with the truncated form of matriptase given in AAB19551. Either form can be produced in transformed or transfected cells using a claimed method. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Region

thereof, which have properties related to the stimulation of biochemical corphysiological responses in a cell, tissue, organ or organism. Specifically, it refers to the use of biologically active fragments for diagnostic and prognostic assays and furthermore in the treatment of converse pathological conditions. The present invention describes novel than and murine NOVX proteins, as well as methods to modulate their cexpression using antisense oligos, ribozymes and peptide nucleic acids. The NOVX polypeptides, polynucleotides and antibodies are useful in treating or preventing NOVX associated disorders, e.g. cardiomyopathy, catherosclerosis, cancer and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune cdiscorders, allergies, blood disorders, acquired immunodeficiency syndrome (AIDS), obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, carthritis, Alzheimer's disease, infections, stroke, muscular dystrophy condeplepsy. Accordingly, these molecules have many activities including cytostatic, cardiant, antidiabetic, antiarteroisclerosic, anorectic, antiarteroisclerosics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antiasthmatic, nephrotropic, antiarteriosclerotic, anorectic, neuroprotective, nootropic, antiatratricic, hepatotropic, neuroprotective, nootropic, antiatratricic, hepatotropic, relaxant and anticonvulsant. In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also used as in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. This polypeptide is a homologue of a human NOVX protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Li L, G

This invention relates to a novel nucleic acids, and encoded polypeptides CC thereof, which have properties related to the stimulation of biochemical cor physiological responses in a cell, tissue, organ or organism. CC Specifically, it refers to the use of biologically active fragments for diagnostic and prognostic assays and furthermore in the treatment of CC diagnostic and prognostic assays and furthermore in the treatment of CC diverse pathological conditions. The present invention describes novel thuman and murine NOVX proteins, as well as methods to modulate their CC man and murine NOVX proteins, as well as methods to modulate their CC resting or preventing NOVX-associated dispress and antibodies are useful in CC treating or preventing NOVX-associated dispress, e. cardiomyopathy, CC atheroscierosis, cancer and diabetes. Furthermore, they may be used in CC treating or preventing diseases such as inflammation, autoimmune CC treating or preventing diseases such as inflammation, autoimmune CC disorders, altergies, blood disorders, acquired immunodeficiency syndrome CC (AIDS), obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, and artificially the company of the contractivity in the conditions, stroke, muscular dystrophy and conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-MAR-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antiasthmatic, nephrotropic, antiarthritic, hepatotropic, neuroprotective, nootropic, antibacterial, virucide, antiparasitic, relaxant and anticonvulsant. In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also used as in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. This polypeptide is a homologue of a human NOVX protein

New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing or

Disclosure; SEQ ID NO 412; 1498pp; English.

CC or physiological responses in a cell, tissue, organ or organism.

CC Specifically, it refers to the use of biologically active fragments for CC diagnostic and prognostic assays and furthermore in the treatment of CC diverse pathological conditions. The present invention describes novel CC human and murine NOVX proteins, as well as methods to modulate their CC expression using antisense oligos, ribozymes and peptide nucleic acids. CC The NOVX polypeptides, polynucleotides and antibodies are useful in CC treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, catherosclerosis, cancer and diabetes. Furthermore, they may be used in CC treating or preventing diseases such as inflammation, autoimmune CC disorders, allergies, blood disorders, acquired immunodeficiency syndrome CC (AIDS), obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, CC arthritis, Alzheimer's disease, infections, stroke, muscular dystrophy CC and epilepsy. Accordingly, these molecules have many activities including CC cytostatic, anti-HTV, antidiabetic, antiarteriosclerotic, anorectic, correspondentive, nootropic, antibacterial, virucide, antiparasitic, crelaxant and anticonvulsant. In addition, they are useful in screening CC assays to identify small molecules that modulate or inhibit, for example, correspondentic, wound healing and angiogenesis. The nucleic acids are also used as in chromosome mapping, tissue typing, preventive medicine and coff the invention. This invention thereof, which lor physiologica. invention. relates to have proper properties a novel related to the stimulation of polypeptides biochemical

                                                                                                                                                   The invention relates to nucleic acids and proteins
                                                                                                                                                                   Claim 12; SEQ
                                                                                                                                                                  ID NO C237; 1385pp; English.
                                                                                                                                                                                            patient,
detecting
```

cc whose expression is upregulated or downregulated in specific cancers or cother diseases such as angiogenic or fibrotic disorders, and to methods co fetermining the presence or absence of a pathological cell in a cc patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The current in also relates to expression vectors and host cells comprising a curleic acid of the invention; antibodies which specifically bind a cc polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the collipse and nucleic acids. The nucleic acids, polypeptides, and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal conevascularistation syndromes, scarring and uterine fibroids. They may calso be useful in wound healing and in contraception. The present (ADN38683-ADN40064)

The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bodary

This invention relates to a novel nucleic acids, and encoded polypeptides CC thereof, which have properties related to the stimulation of biochemical CC or physiological responses in a cell, tissue, organ or organism. CC Specifically, it refers to the use of biologically active fragments for CC diagnostic and prognostic assays and furthermore in the treatment of CC diverse pathological conditions. The present invention describes novel human and murine NOVX protectins, as well as methods to modulate their CC expression using antisense oligos, ribozymes and peptide nucleic acids. CC The NOVX polypeptides, polymucleotides and antibodies are useful in CC treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, CC atherosclerosis, cancer and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune CC (AIDS), obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, CC arthritis, Alzheimer's disease, infections, stroke, muscular dystrophy CC and epilepsy. Accordingly, these molecules have many activities including C cytostatic, cardiant, antiinflammatory, immunosuppressive, antiallergic, haemostatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14.WAR-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antiasthmatic, nephrotropic, antiarthritic, hepatotropic, neuroprotective, nootropic, antibacterial, virucide, antiparasitic, relaxant and anticonvulsant. In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also used as in chromosome mapping, tissue typing, preventive medicine and used as in chromosome mapping, tissue typing, preventive medicine and parameters. This polypeptide is a homologue of a human NOVX protein

New NOVX polypeptides and nucl treating NOVX-associated diso atherosclerosis, or diabetes, d nucleic acids, useful for preventing or disorders, e.g. cancer, cardiomyopathy, etes, and in chromosome mapping, tissue typing or

Disclosure; SEQ ID NO 354; 1498pp; English

This invention relates to a novel nucleic acids, and encoded polypeptides thereof, which have properties related to the stimulation of biochemical or physiological responses in a cell, tissue, organ or organism. Specifically, it refers to the use of biologically active fragments for diagnostic and prognostic assays and furthermore in the treatment of diverse pathological conditions. The present invention describes novel human and murine NOVX proteins, as well as methods to modulate their expression using antisense oligos, ribozymes and peptide nucleic acids. The NOVX polypeptides, polynucleotides and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune disorders, allergies, blood disorders, acquired immunodeficiency syndrome athmospheric acthma immunodeficiency syndrome athmas acthma athmas at mass at a such as athmas at a such as athmas at a such as athmas at a such as a such as athmas at a such as athmas at a such at a such as a such a (AIDS) obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, arthritis, Alzhelmer's disease, infections, stroke, muscular dystrophy and epilepsy. Accordingly, these molecules have many activities including cytostatic, cardiant, antiinflammatory, immunosuppressive, antiallergic, haemostatic, anti-HIV, antidiabetic, antiarthritic, hepatotropic, anorectic, antiasthmatic, nephrotropic, antiarthritic, hepatotropic, antiparasitic, relaxant and anticonvulsant. In addition, they are useful in screening assays to identify small molecules that modulate or inhibit, for example, neurogenesis, wound healing and angiogenesis. The nucleic acids are also used as in chromosome mapping, tissue typing, preventive medicine and farmacogenomics. This polypeptide is a homologue of a human NOVX protein

New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing pharmacogenomics. or

Claim 1; SEQ ID NO 44; 1498pp; English

This invention relates to a novel nucleic acids, and encoded polypeptides CC thereof, which have properties related to the stimulation of biochemical CC or physiological responses in a cell, tissue, organ or organism. CC Specifically, it refers to the use of biologically active fragments for CC diagnostic and prognostic assays and furthermore in the treatment of CC diverse pathological conditions. The present invention describes movel thuman and murine NOVX proteins, as well as methods to modulate their CC expression using antisense oligos, ribozymes and peptide nucleic acids. CC The NOVX polypeptides, polymuclectides and antibodies are useful in CC treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, CC atherosclerosis, cancer and diabetes. Furthermore, they may be used in treating or preventing diseases such as inflammation, autoimmune CC disorders, allergies, blood disorders, acquired immunodeficiency syndrome (AIDS), obesity, asthma, immunoglobulin (Ig)A nephropathy, cirrhosis, and epilepsy. Accordingly, these molecules have many activities including CC vctostatic, cardiant, antinflammatory, immunosuppressive, antiallergic, antiasthmatic, nephrotropic, antiarteriosclerotic, anorectic, constraints, cardiant, antinflammatory, immunosuppressive, antiallergic, nephrotropic, antiarteriosclerotic, antiarterioc antiasthmatic, nephrotropic, antiarteriosclerotic, antiparasitic, relaxant and anticonvulsant. In addition, they are useful in screening creations, they are useful in screening answer to identify small molecules that modulate or inhibit, for example,

```

The present sequence represents a novel human extracellular serine protease, termed tumour antigen derived gene-15 protein (see AAY06671), that is overrexpressed in breast and ovarian carcinomas. The TADG-15 gene (see AAX87815) can be used as a diagnostic and therapeutic target in ovarian carcinoma and other carcinomas including breast, prostate, lung and colon. The ligand binding domains of TADG-15 may be valuable in the uptake of specific molecules into tumour cells. The invention also provides: a vector that is capable of expressing DNA encoding TADG-15 protein; host cells selected from bacterial cells (especially Escherichia coli), mammalian cells, plant cells and insect cells; and a method of detecting expression of TADG-15 protein using a hybridisation probe Sequence 855 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents human tumour antigen-derived gene 15 (TADG-15) protein. TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer

                                                                                                                                                                                                                                                                                         The invention relates to transmembrane serine proteases and their corresponding nucleotides and the protease domain of a type-II membrane-type serine protease (MTSP). MTSP is useful for identifying compounds that modulate or inhibits its proteolytic activity and for formulating a medicament for treating neoplastic disease. MTSP and its corresponding nucleotides are useful in preventing or treating tumours or cancers such as lung carcinoma, colon adenocarcinoma and ovarian carcinoma, in diagnostics and in hybridisation assays. MTSP is useful as a diagnostic marker for tumour development, growth and/or progression and as immunogens to generate antibodies that specifically bind to it. MTSP DNA is useful in a yeast two-hybrid system and in gene therapy. The present sequence is human MTSP1 protein (also called matriptase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key
